Tech stack

Languages

JavaScript, TypeScript, Python

Frontend

React, Next.js

Backend

Node.js, NestJS, Express
Python (FastAPI, Django)

Data & Messaging

PostgreSQL, MongoDB, ClickHouse
Kafka, Redis

DevOps & Observability

Docker, Kubernetes, GitLab CI/CD
Prometheus, Grafana, OpenSearch

AI/ML

LLM, RAG, LangChain

Profile

Technical Lead with 11+ years of experience building and scaling backend platforms, distributed systems and AI-powered products.

Expertise in Node.js, TypeScript, distributed systems, system design and software architecture.

Delivered products from MVP to production across biometric, AI and e-commerce domains, including high-availability systems supporting 1000+ RPS.

Combines hands-on engineering with technical leadership, architecture ownership and mentoring. Focused on scalable solutions, engineering excellence and measurable business outcomes.

Employment

Selected Experience

MTS Digital, CTO Biometrics Stream

01/2021 – 02/2025

Products: Commercial Biometric System (CBS), KYC Verification Service and AI Recognition Platform, supporting biometric identification, remote onboarding and fraud prevention services for enterprise customers.

Key Objectives:

- Deliver biometric and KYC products from MVP to production
- Design scalable and highly available distributed systems
- Establish engineering practices and technical leadership across teams

Achievements:

- Built the Commercial Biometric System (CBS) from scratch, delivering an MVP in 4 months and launching it into production with the first enterprise client.
- Designed and evolved highly available distributed architectures supporting 1000+ RPS and 99.99% SLA.
- Combined biometric, KYC and AI products into a unified ecosystem, reducing operational costs by 30% and shortening integrations from 2 weeks to 5 days.
- Built shared DevOps and Support functions, improving platform uptime from 97.5% to 99.95%.
- Led engineering organization through 3 Team Leads, scaling engineering capabilities across 35+ engineers.

Tech Stack: Node.js, .NET, PostgreSQL, Kafka, Redis, K8s, Docker.

Recent Engagements

Nevada group, Tech Lead

01/2026 – 06/2026 | Russia

Samberi (e-commerce) — retail platform supporting 300+ stores, with multiple integrations, legacy systems and high availability requirements.

Education

Information processing and management systems, Bauman Moscow State Technical University

09/2015 – 08/2019

Moscow, Russia

Skills

- Technical Leadership
- System Design & Architecture
- Distributed Systems
- Delivery & Engineering Processes
- High-Load Systems
- Code Review & Mentoring

Key objectives:

- Improve engineering practices
- Increase delivery predictability
- Improve platform reliability

Achievements:

- Led engineering transformation across a 13+ engineer organization (6 *backend*, 2 *frontend*, 2 *QA*, 2 *mobile engineers*, 1 *devOps*), coordinating delivery across *internal* and *outsourced* teams.
- Established engineering quality practices, including code review, automated testing and release management, increasing release frequency from weekly to 2–3 deployments per week.
- Implemented observability standards across the platform, including monitoring, alerting, logging and incident diagnostics, reducing production incidents by ~80%.
- Introduced dynamic development environments, enabling parallel testing and feature validation, eliminating the growing QA backlog and removing a major delivery bottleneck.
- Led architectural modernization initiatives focused on technical debt reduction, scalability and long-term maintainability.

Tech Stack: Python, Node.js, PostgreSQL, MongoDB, Redis, Kafka, Docker, K8s.

Unimatch Lab, Tech Lead

05/2025 – 01/2026

TOYS AI – venture-backed AI product combining conversational AI, agent-based workflows and connected hardware.

Key Objectives:

- Deliver MVP for investor and customer demonstrations
- Define scalable product and AI architecture
- Establish engineering foundations and initial team

Achievements:

- Built the first working MVP in 2 weeks as the sole engineer, delivering a functional prototype for investor presentations and customer demonstrations.
- Developed core product capabilities, including AI-powered toy interaction, child profile management and safety policy enforcement.
- Designed AI and system architecture, including LLM integration and agent-based workflows.
- Recruited and onboarded the first backend engineers, helping establish the initial engineering team.
- Defined hardware architecture and device integration requirements for future product development.

Tech Stack: Node.js, NestJS, PostgreSQL, OpenAI API, LangChain, WebSockets, Docker.

MetaLamp, Architect, Part-Time Consulting

02/2025 – 04/2025

Secure Corporate LLM Platform — enterprise AI platform designed to enable secure LLM adoption while enforcing organizational AI risk policies.

Key Objectives:

- Design architecture for secure enterprise LLM adoption
- Define technical foundations, deployment strategy and implementation roadmap

Achievements:

- Designed system architecture and key components using the C4 model.
- Defined on-premise deployment architecture and infrastructure requirements.
- Evaluated security controls, guardrails and integration architecture for enterprise environments.
- Selected core technologies, including LLM, RAG and security components.
- Prepared implementation roadmap and delivery guidelines for engineering teams.

Tech Stack: Node.js, PostgreSQL, LLM, RAG, Kubernetes, C4 Modeling.
